README

1. Please run the   file **Main_Top_module.m** and that takes care of everything.

    2. There are separate **if conditions** for all four files and prediction challenge
   for all the four different files and the prediction challenge file. The loop condition for that particular case has to be made (i.e **if 1** should be made). For example, to run test50b.txt, the if condition corresponding to that Should be made 1.

3. All the input and output data files should be put in the same folder before running Main_top_module. Even other function files should be put in same folder.
